

Bunker Hill Community College

Final Statistics Exam 2019-05-02

Exam ID 016

Name: _____

This take-home exam is due **Wednesday, May 8**, at the beginning of class.

You may use any notes, textbook, or online tools; however, you may not request help from any other human.

You will show your work on the pages with questions. When you are sure of your answers, you will **put those answers in the boxes** on the first few pages.

Unless you have an objection to doing so, please **copy the honor-code text below and sign**.

I understand that outside help is NOT allowed on this exam. On my honor, the work herein is my own.

Signature: _____

1. (a)
- (b)
- (c)
- (d)
- (e)
- (f)
2.
3.
4. (a)
- (b)
5.
6. (a)
- (b)
- (c)
- (d)
- (e)
- (f)
- (g)
7. (a)
- (b)

8. (a)
- (b)
- (c)
- (d)
- (e)
- (f)
- (g)

1. In a deck of strange cards, there are 1021 cards. Each card has an image and a color. The amounts are shown in the table below.

	black	blue	violet	white
bike	86	58	99	62
gem	94	25	15	92
shovel	96	17	82	85
wheel	44	52	74	40

- (a) What is the probability a random card is a bike given it is black?
- (b) What is the probability a random card is both a bike and white?
- (c) What is the probability a random card is either a shovel or violet (or both)?
- (d) What is the probability a random card is a wheel?
- (e) What is the probability a random card is white given it is a bike?
- (f) What is the probability a random card is white?

2. In a deck of strange cards, each card has an image and a color. The chance of drawing a shovel is 48.5%. If a shovel is drawn, there is a 84.9% chance that it is pink. If a card that is not a shovel is drawn, there is a 29.6% chance that it is pink.

Now, someone draws a random card and reveals it is not pink. What is the chance the card is not a shovel?

3. In a very large pile of toothpicks, the mean length is 60.04 millimeters and the standard deviation is 1.35 millimeters. If you randomly sample 120 toothpicks, what is the chance the sample mean is between 59.97 and 60.24 millimeters?

4. In a game, there is a 89% chance to win a round. You will play 122 rounds.
- (a) What is the probability of winning exactly 107 rounds?
 - (b) What is the probability of winning at least 106 but at most 115 rounds?

5. As an ornithologist, you wish to determine the average body mass of *Oporornis formosus*. You randomly sample 15 adults of *Oporornis formosus*, resulting in a sample mean of 15.63 grams and a sample standard deviation of 3.84 grams. Determine a 90% confidence interval of the true population mean.

6. A treatment group of size 28 has a mean of 1100 and standard deviation of 206. A control group of size 9 has a mean of 981 and standard deviation of 141. If you decided to use a significance level of 0.05, is there sufficient evidence to conclude the treatment causes an effect?

By using the Welch-Satterthwaite equation, I've calculated the degrees of freedom should be 19.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p -value. Otherwise, describe an interval containing the p -value.
- (g) Do we reject or retain the null?

7. From a very large population, a random sample of 4500 individuals was taken. In that sample, 17.4% were frigid. Determine a 90% confidence interval of the population proportion.
- (a) Find the lower bound of the confidence interval.
 - (b) Find the upper bound of the confidence interval.

8. An experiment is run with a treatment group of size 118 and a control group of size 111. The results are summarized in the table below.

	treatment	control
sick	106	85
not sick	12	26

Using a significance level of 0.01, determine whether the treatment causes an effect on the proportion of cases that are sick.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p -value. Otherwise, describe an interval containing the p -value.
- (g) Do we reject or retain the null?
