Bunker Hill Community College

Final Statistics Exam 2019-05-02

Exam ID 030

Name:
nis take-home exam is due Wednesday, May 8 , at the beginning of class.
ou may use any notes, textbook, or online tools; however, you may not request help from an her human.
ou will show your work on the pages with questions. When you are sure of your answers, you those answers in the boxes on the first few pages.
nless you have an objection to doing so, please copy the honor-code text below and sign
understand that outside help is NOT allowed on this exam. On my honor, the work herein i my own.
Signature:

- 1. (a) P(horn and orange) = 0.0911
 - (b) P(wheel or white) = 0.411
 - (c) P(white) = 0.251
 - (d) P(bike given orange) = 0.21
 - (e) $P(\mathbf{dog}) = 0.224$
 - (f) P(pink given dog) = 0.345
- 2. P("not gem" given "red") = 0.231
- 3. P(64.96 < X < 65.89) = 0.7141
- 4. (a) P(X = 24) = 0.0728
 - (b) $P(18 \le X \le 35) = 0.9375$
- 5. **(33.8, 41.1)**
- 6. (a) $H_0: \mu_2 \mu_1 = 0$
 - (b) $H_0: \mu_2 \mu_1 \neq 0$
 - (c) $t^* = 2.41$
 - (d) SE = 0.16
 - (e) $| t_{obs} | = 2.26$
 - (f) 0.02 < p-value < 0.04
 - (g) retain
- 7. (a) **LB of p CI = 0.625 or** 62.5%
 - (b) **UB of p CI = 0.633 or** 63.3%

8. (a)
$$H_0: p_2 - p_1 = 0$$

(b)
$$H_{A}: p_2 - p_1 \neq 0$$

(c)
$$Z^* = 2.58$$

(d)
$$SE = 0.026$$

(e)
$$|Z_{obs}| = 2.71$$

(f)
$$p$$
-value = 0.0068

1. In a deck of strange cards, there are 790 cards. Each card has an image and a color. The amounts are shown in the table below.

	gray	orange	pink	white
bike	54	45	85	77
dog	53	24	61	39
horn	16	72	55	56
wheel	23	73	31	26
dog horn	53 16	24 72	61 55	5

- (a) What is the probability a random card is both a horn and orange?
- (b) What is the probability a random card is either a wheel or white (or both)?
- (c) What is the probability a random card is white?
- (d) What is the probability a random card is a bike given it is orange?
- (e) What is the probability a random card is a dog?
- (f) What is the probability a random card is pink given it is a dog?

(a)
$$P(\text{horn and orange}) = \frac{72}{790} = 0.0911$$

(b)
$$P(\text{wheel or white}) = \frac{23+73+31+26+77+39+56+26-26}{790} = 0.411$$

(c)
$$P(\text{white}) = \frac{77+39+56+26}{790} = 0.251$$

(d)
$$P(bike given orange) = \frac{45}{45+24+72+73} = 0.21$$

(e)
$$P(dog) = \frac{53+24+61+39}{790} = 0.224$$

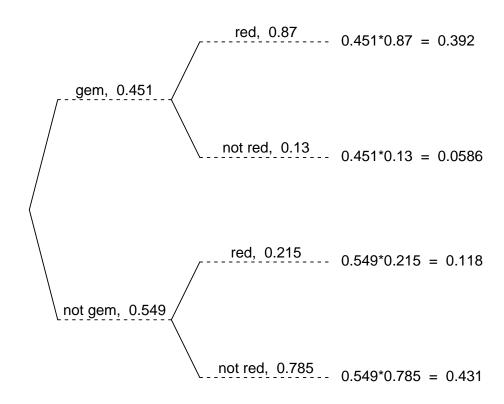

(f)
$$P(\text{pink given dog}) = \frac{61}{53+24+61+39} = 0.345$$

2. In a deck of strange cards, each card has an image and a color. The chance of drawing a gem is 45.1%. If a gem is drawn, there is a 87% chance that it is red. If a card that is not a gem is drawn, there is a 21.5% chance that it is red.

Now, someone draws a random card and reveals it is red. What is the chance the card is not a gem?

I'd recommend making a tree. Remember, on the first branch, we put simple probabilities. On the second branches we put conditional probabilities. The results (products) are joint probabilities.

Determine the appropriate conditional probability.

$$P(\text{"not gem" given "red"}) = \frac{0.118}{0.118 + 0.392} = 0.231$$

3. In a very large pile of toothpicks, the mean length is 65.72 millimeters and the standard deviation is 3.84 millimeters. If you randomly sample 169 toothpicks, what is the chance the sample mean is between 64.96 and 65.89 millimeters?

Label the given information.

$$\mu = 65.72$$
 $\sigma = 3.84$
 $n = 169$
 $\bar{x}_{lower} = 64.96$
 $\bar{x}_{upper} = 65.89$

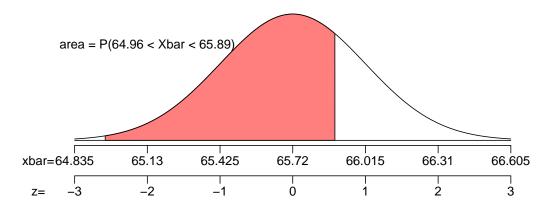

Find the standard error.

$$SE = \frac{\sigma}{\sqrt{n}} = \frac{3.84}{\sqrt{169}} = 0.295$$

Describe the sampling distribution.

$$\bar{X} \sim \mathcal{N}(65.72, 0.295)$$

Draw a sketch.

Calculate a z scores.

$$Z_{\text{lower}} = \frac{X_{\text{lower}} - \mu}{SE} = \frac{64.96 - 65.72}{0.295} = -2.58$$

$$z_{\text{upper}} = \frac{x_{\text{upper}} - \mu}{SE} = \frac{65.89 - 65.72}{0.295} = 0.58$$

Determine the probability.

$$P(64.96 < X < 65.89) = \Phi(z_{upper}) - \Phi(z_{lower})$$

= $\Phi(0.58) - \Phi(-2.58)$
= 0.7141

- 4. In a game, there is a 13% chance to win a round. You will play 206 rounds.
 - (a) What is the probability of winning exactly 24 rounds?
 - (b) What is the probability of winning at least 18 but at most 35 rounds?

We use the formula for binomial probabilities.

$$P(X = k) = \binom{n}{k} (p)^k (1 - p)^{n-k}$$

$$P(X = 24) = \binom{206}{24} (0.13)^{24} (1 - 0.13)^{206-24}$$

$$P(X = 24) = \binom{206}{24} (0.13)^{24} (0.87)^{182}$$

$$P(X = 24) = 0.0728$$

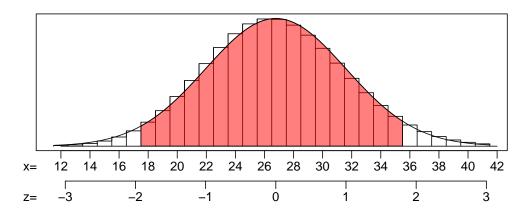

Find the mean.

$$\mu = np = (206)(0.13) = 26.78$$

Find the standard deviation.

$$\sigma = \sqrt{np(1-p)} = \sqrt{(206)(0.13)(1-0.13)} = 4.8269$$

Make a sketch, specifically try to picture whether you need to add or subtract 0.5 for the continuity correction.

Find the z scores.

$$z_1 = \frac{17.5 - 26.78}{4.8269} = -1.92$$

$$Z_2 = \frac{35.5 - 26.78}{4.8269} = 1.81$$

Calculate the probability.

$$P(18 < X < 35) = \Phi(1.81) - \Phi(-1.92) = 0.9375$$

(a)
$$P(X = 24) = 0.0728$$

(b)
$$P(18 < X < 35) = 0.9375$$

5. As an ornithologist, you wish to determine the average body mass of *Piranga rubra*. You randomly sample 31 adults of *Piranga rubra*, resulting in a sample mean of 37.46 grams and a sample standard deviation of 6.73 grams. Determine a 99.5% confidence interval of the true population mean.

We are given the sample size, sample mean, sample standard deviation, and confidence level.

$$n = 31$$

 $\bar{x} = 37.46$
 $s = 6.73$
 $CL = 0.995$

Determine the degrees of freedom (because we don't know σ and we are doing inference so we need to use the t distribution).

$$df = n - 1 = 30$$

Determine the critical t value, t^* , such that $P(|T| < t^*) = 0.995$.

$$t^* = 3.03$$

Calculate the standard error.

$$SE = \frac{s}{\sqrt{n}} = \frac{6.73}{\sqrt{31}} = 1.21$$

We want to make an inference about the population mean.

$$\mu \approx \bar{x} \pm t^* SE$$

Determine the bounds.

$$CI = (\bar{x} - t^*SE, \ \bar{x} + t^*SE)$$

= $(37.46 - 3.03 \times 1.21, \ 37.46 + 3.03 \times 1.21)$
= $(33.8, \ 41.1)$

We are 99.5% confident that the population mean is between 33.8 and 41.1.

6. A treatment group of size 31 has a mean of 9.94 and standard deviation of 0.647. A control group of size 19 has a mean of 10.3 and standard deviation of 0.477. If you decided to use a signficance level of 0.02, is there sufficient evidence to conclude the treatment causes an effect?

By using the Welch-Satterthwaite equation, I've calculated the degrees of freedom should be 46.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

We are given unpaired data. We are considering a difference of means. Label the given information.

$$n_1 = 31$$

 $\bar{x}_1 = 9.94$
 $s_1 = 0.647$
 $n_2 = 19$
 $\bar{x}_2 = 10.3$
 $s_2 = 0.477$
 $\alpha = 0.02$
 $df = 46$

State the hypotheses.

$$H_0: \mu_2 - \mu_1 = 0$$

 $H_A: \mu_2 - \mu_1 \neq 0$

We are using a two-tail test. Find t^* such that $P(|T| > t^*) = 0.02$ by using a t table.

$$t^* = 2.41$$

Calculate the standard error.

$$SE = \sqrt{\frac{(s_1)^2}{n_1} + \frac{(s_2)^2}{n_2}}$$
$$= \sqrt{\frac{(0.647)^2}{31} + \frac{(0.477)^2}{19}}$$
$$= 0.16$$

Determine the test statistic.

$$t_{\text{obs}} = \frac{(\bar{x}_2 - \bar{x}_1) - (\mu_2 - \mu_1)_0}{SE}$$
$$= \frac{(10.3 - 9.94) - (0)}{0.16}$$
$$= 2.26$$

Compare $|t_{obs}|$ and t^* .

$$|\mathit{t}_{\mathsf{obs}}| < \mathit{t}^{\star}$$

We can determine an interval for the *p*-value using the *t* table.

Compare *p*-value and α .

$$p$$
-value $> \alpha$

We conclude that we should retain the null hypothesis.

(a)
$$H_0$$
: $\mu_2 - \mu_1 = 0$

- (b) H_A : $\mu_2 \mu_1 \neq 0$
- (c) $t^* = 2.41$
- (d) SE = 0.16
- (e) $|t_{obs}| = 2.26$
- (f) 0.02 < p-value < 0.04
- (g) retain the null

- 7. From a very large population, a random sample of 91000 individuals was taken. In that sample, 62.9% were cold. Determine a 99.5% confidence interval of the population proportion.
 - (a) Find the lower bound of the confidence interval.
 - (b) Find the upper bound of the condifence interval.

Determine z^* such that $P(|Z| < z^*) = 0.995$.

$$z^* = 2.81$$

Calculate the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n}} = \sqrt{\frac{(0.629)(1-0.629)}{91000}} = 0.0016$$

Calculate the margin of error.

$$ME = z^*SE = (2.81)(0.0016) = 0.0045$$

To find the confidence interval's bounds, find the sample proportion plus or minus the margin of error.

$$p \approx \hat{p} \pm ME$$

Determine the interval.

We are 99.5% confident that the true population proportion is between 62.5% and 63.3%.

- (a) The lower bound = 0.625, which can also be expressed as 62.5%.
- (b) The upper bound = 0.633, which can also be expressed as 63.3%.

8. An experiment is run with a treatment group of size 168 and a control group of size 194. The results are summarized in the table below.

	treatment	control
special	151	188
not special	17	6

Using a significance level of 0.01, determine whether the treatment causes an effect on the proportion of cases that are special.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

State the hypotheses.

$$H_0: p_2 - p_1 = 0$$

 $H_A: p_2 - p_1 \neq 0$

Find z^* such that $P(|Z| > z^*) = 0.01$.

$$z^* = \Phi^{-1} \left(1 - \frac{\alpha}{2} \right) = 2.58$$

Determine the sample proportions.

$$\hat{p}_1 = \frac{151}{168} = 0.899$$

$$\hat{p}_2 = \frac{188}{194} = 0.969$$

Determine the difference of sample proportions.

$$\hat{p}_2 - \hat{p}_1 = 0.969 - 0.899 = 0.07$$

Determine the pooled proportion (because the null assumes the population proportions are equal).

$$\hat{p} = \frac{151 + 188}{168 + 194} = 0.936$$

Determine the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n_1} + \frac{\hat{p}(1-\hat{p})}{n_2}}$$
$$= \sqrt{\frac{(0.936)(0.064)}{168} + \frac{(0.936)(0.064)}{194}}$$
$$= 0.0258$$

We can be more specific about what the null hypothesis claims.

$$H_0: \hat{P}_2 - \hat{P}_1 \sim \mathcal{N}(0, 0.0258)$$

We want to describe how unusual our observation is under the null by finding the p-value. To do so, first find the z score.

$$Z = \frac{(\hat{p}_2 - \hat{p}_1) - (p_2 - p_1)_0}{SE}$$
$$= \frac{(0.969 - 0.899) - 0}{0.0258}$$
$$= 2.71$$

Determine the *p*-value.

$$p$$
-value = $2 \cdot \Phi(-|z|)$
= $2 \cdot \Phi(-2.71)$
= 0.0068

Compare the *p*-value to the signficance level.

$$p$$
-value $< \alpha$

So, we reject the null hypothesis. Thus the difference in proportions is significant.

- (a) $H_0: p_2 p_1 = 0$
- (b) $H_A: p_2 p_1 \neq 0$
- (c) $z^* = 2.58$
- (d) SE = 0.0258
- (e) $|z_{obs}| = 2.71$
- (f) p-value = 0.0068
- (g) reject the null
