Bunker Hill Community College

Final Statistics Exam 2019-05-02

Exam ID 012

his take-home exam is due Wednesday, May 8 , at the beginning of class.
fou may use any notes, textbook, or online tools; however, you may not request help from an other human.
ou will show your work on the pages with questions. When you are sure of your answers, yow ill put those answers in the boxes on the first few pages.
Jnless you have an objection to doing so, please copy the honor-code text below and sign
I understand that outside help is NOT allowed on this exam. On my honor, the work herein is my own.
Signature:

- 1. (a) P(flower) = 0.206
 - (b) P(dog and gray) = 0.0662
 - (c) P(cat given black) = 0.231
 - (d) P(gem or blue) = 0.531
 - (e) P(blue) = 0.304
 - (f) P(black given cat) = 0.177
- 2. P("not ring" given "green") = 0.761
- 3. P(63 < X < 63.33) = 0.4773
- 4. (a) P(X = 119) = 0.0601
 - (b) $P(109 \le X \le 121) = 0.5057$
- 5. **(10, 10.5)**
- 6. (a) H_0 : $\mu_2 \mu_1 = 0$
 - (b) $| H_0 : \mu_2 \mu_1 \neq 0$
 - (c) $t^* = 2.01$
 - (d) SE = 0.011
 - (e) $| t_{obs} | = 1.77$
 - (f) 0.05 < p-value < 0.1
 - (g) retain
- 7. (a) **LB of p CI = 0.658 or** 65.8%
 - (b) **UB of p CI = 0.678 or** 67.8%

8. (a)
$$H_0: p_2 - p_1 = 0$$

(b)
$$H_{A}: p_2 - p_1 \neq 0$$

(c)
$$Z^* = 1.64$$

(d)
$$SE = 0.038$$

(e)
$$|Z_{obs}| = 1.58$$

(f)
$$p$$
-value = 0.1142

1. In a deck of strange cards, there are 907 cards. Each card has an image and a color. The amounts are shown in the table below.

	black	blue	gray	teal
cat	45	73	80	56
dog	54	61	60	18
flower	15	75	63	34
gem	81	67	53	72

- (a) What is the probability a random card is a flower?
- (b) What is the probability a random card is both a dog and gray?
- (c) What is the probability a random card is a cat given it is black?
- (d) What is the probability a random card is either a gem or blue (or both)?
- (e) What is the probability a random card is blue?
- (f) What is the probability a random card is black given it is a cat?

(a)
$$P(flower) = \frac{15+75+63+34}{907} = 0.206$$

(b)
$$P(\text{dog and gray}) = \frac{60}{907} = 0.0662$$

(c)
$$P(\text{cat given black}) = \frac{45}{45+54+15+81} = 0.231$$

(d)
$$P(\text{gem or blue}) = \frac{81+67+53+72+73+61+75+67-67}{907} = 0.531$$

(e)
$$P(blue) = \frac{73+61+75+67}{907} = 0.304$$

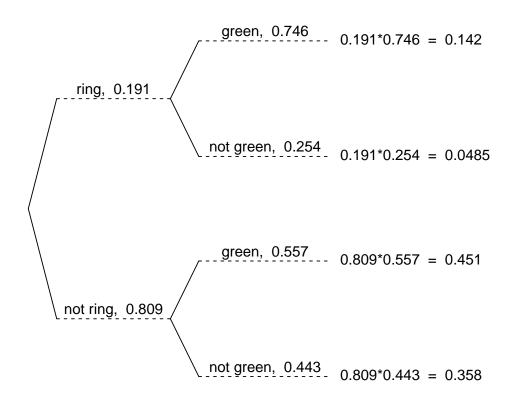

(f)
$$P(\text{black given cat}) = \frac{45}{45+73+80+56} = 0.177$$

2. In a deck of strange cards, each card has an image and a color. The chance of drawing a ring is 19.1%. If a ring is drawn, there is a 74.6% chance that it is green. If a card that is not a ring is drawn, there is a 55.7% chance that it is green.

Now, someone draws a random card and reveals it is green. What is the chance the card is not a ring?

I'd recommend making a tree. Remember, on the first branch, we put simple probabilities. On the second branches we put conditional probabilities. The results (products) are joint probabilities.

image color

Determine the appropriate conditional probability.

$$P(\text{"not ring" given "green"}) = \frac{0.451}{0.451 + 0.142} = 0.761$$

3. In a very large pile of toothpicks, the mean length is 63.2 millimeters and the standard deviation is 3.83 millimeters. If you randomly sample 225 toothpicks, what is the chance the sample mean is between 63 and 63.33 millimeters?

Label the given information.

$$\mu = 63.2$$
 $\sigma = 3.83$
 $n = 225$
 $\bar{x}_{lower} = 63$
 $\bar{x}_{upper} = 63.33$

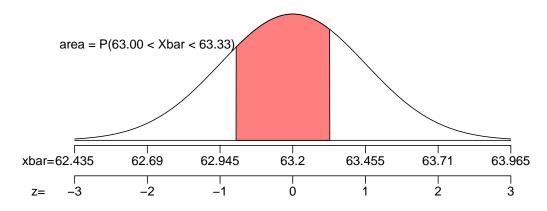

Find the standard error.

$$SE = \frac{\sigma}{\sqrt{n}} = \frac{3.83}{\sqrt{225}} = 0.255$$

Describe the sampling distribution.

$$\bar{X} \sim \mathcal{N}(63.2, 0.255)$$

Draw a sketch.

Calculate a z scores.

$$Z_{\text{lower}} = \frac{X_{\text{lower}} - \mu}{SE} = \frac{63 - 63.2}{0.255} = -0.78$$

$$z_{\text{upper}} = \frac{x_{\text{upper}} - \mu}{SE} = \frac{63.33 - 63.2}{0.255} = 0.51$$

Determine the probability.

$$P(63 < X < 63.33) = \Phi(z_{upper}) - \Phi(z_{lower})$$

= $\Phi(0.51) - \Phi(-0.78)$
= 0.4773

- 4. In a game, there is a 68% chance to win a round. You will play 178 rounds.
 - (a) What is the probability of winning exactly 119 rounds?
 - (b) What is the probability of winning at least 109 but at most 121 rounds?

We use the formula for binomial probabilities.

$$P(X = k) = \binom{n}{k} (p)^k (1 - p)^{n-k}$$

$$P(X = 119) = \binom{178}{119} (0.68)^{119} (1 - 0.68)^{178 - 119}$$

$$P(X = 119) = \binom{178}{119} (0.68)^{119} (0.32)^{59}$$

$$P(X = 119) = 0.0601$$

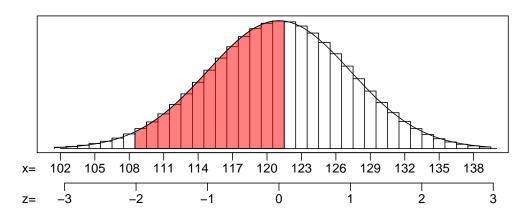

Find the mean.

$$\mu = np = (178)(0.68) = 121.04$$

Find the standard deviation.

$$\sigma = \sqrt{np(1-p)} = \sqrt{(178)(0.68)(1-0.68)} = 6.2236$$

Make a sketch, specifically try to picture whether you need to add or subtract 0.5 for the continuity correction.

Find the z scores.

$$z_1 = \frac{108.5 - 121.04}{6.2236} = -2.01$$

$$Z_2 = \frac{121.5 - 121.04}{6.2236} = 0.07$$

Calculate the probability.

$$P(109 \le X \le 121) = \Phi(0.07) - \Phi(-2.01) = 0.5057$$

- (a) P(X = 119) = 0.0601
- (b) $P(109 \le X \le 121) = 0.5057$

5. As an ornithologist, you wish to determine the average body mass of *Dendroica palmarum*. You randomly sample 26 adults of *Dendroica palmarum*, resulting in a sample mean of 10.28 grams and a sample standard deviation of 1 grams. Determine a 80% confidence interval of the true population mean.

We are given the sample size, sample mean, sample standard deviation, and confidence level

$$n = 26$$

$$\bar{x} = 10.28$$

$$s = 1$$

$$CL = 0.8$$

Determine the degrees of freedom (because we don't know σ and we are doing inference so we need to use the t distribution).

$$df = n - 1 = 25$$

Determine the critical t value, t^* , such that $P(|T| < t^*) = 0.8$.

$$t^* = 1.32$$

Calculate the standard error.

$$SE = \frac{s}{\sqrt{n}} = \frac{1}{\sqrt{26}} = 0.196$$

We want to make an inference about the population mean.

$$\mu \approx \bar{x} \pm t^* SE$$

Determine the bounds.

$$CI = (\bar{x} - t^*SE, \bar{x} + t^*SE)$$

= $(10.28 - 1.32 \times 0.196, 10.28 + 1.32 \times 0.196)$
= $(10, 10.5)$

We are 80% confident that the population mean is between 10 and 10.5.

6. A treatment group of size 30 has a mean of 1.03 and standard deviation of 0.052. A control group of size 37 has a mean of 1.01 and standard deviation of 0.0373. If you decided to use a signficance level of 0.05, is there sufficient evidence to conclude the treatment causes an effect?

By using the Welch-Satterthwaite equation, I've calculated the degrees of freedom should be 51.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

We are given unpaired data. We are considering a difference of means. Label the given information.

$$n_1 = 30$$

 $\bar{x}_1 = 1.03$
 $s_1 = 0.052$
 $n_2 = 37$
 $\bar{x}_2 = 1.01$
 $s_2 = 0.0373$
 $\alpha = 0.05$
 $df = 51$

State the hypotheses.

$$H_0: \mu_2 - \mu_1 = 0$$

 $H_A: \mu_2 - \mu_1 \neq 0$

We are using a two-tail test. Find t^* such that $P(|T| > t^*) = 0.05$ by using a t table.

$$t^* = 2.01$$

Calculate the standard error.

$$SE = \sqrt{\frac{(s_1)^2}{n_1} + \frac{(s_2)^2}{n_2}}$$
$$= \sqrt{\frac{(0.052)^2}{30} + \frac{(0.0373)^2}{37}}$$
$$= 0.011$$

Determine the test statistic.

$$t_{\text{obs}} = \frac{(\bar{x}_2 - \bar{x}_1) - (\mu_2 - \mu_1)_0}{SE}$$
$$= \frac{(1.01 - 1.03) - (0)}{0.011}$$
$$= -1.77$$

Compare $|t_{obs}|$ and t^* .

$$|t_{\rm obs}| < t^{\star}$$

We can determine an interval for the *p*-value using the *t* table.

Compare *p*-value and α .

$$p$$
-value $> \alpha$

We conclude that we should retain the null hypothesis.

(a)
$$H_0$$
: $\mu_2 - \mu_1 = 0$

- (b) H_A : $\mu_2 \mu_1 \neq 0$
- (c) $t^* = 2.01$
- (d) SE = 0.011
- (e) $|t_{obs}| = 1.77$
- (f) 0.05 < p-value < 0.1
- (g) retain the null

- 7. From a very large population, a random sample of 19000 individuals was taken. In that sample, 66.8% were asleep. Determine a 99.5% confidence interval of the population proportion.
 - (a) Find the lower bound of the confidence interval.
 - (b) Find the upper bound of the condifence interval.

Determine z^* such that $P(|Z| < z^*) = 0.995$.

$$z^* = 2.81$$

Calculate the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n}} = \sqrt{\frac{(0.668)(1-0.668)}{19000}} = 0.00342$$

Calculate the margin of error.

$$ME = z^*SE = (2.81)(0.00342) = 0.00961$$

To find the confidence interval's bounds, find the sample proportion plus or minus the margin of error.

$$p \approx \hat{p} \pm ME$$

Determine the interval.

We are 99.5% confident that the true population proportion is between 65.8% and 67.8%.

- (a) The lower bound = 0.658, which can also be expressed as 65.8%.
- (b) The upper bound = 0.678, which can also be expressed as 67.8%.

8. An experiment is run with a treatment group of size 135 and a control group of size 102. The results are summarized in the table below.

	treatment	control
glossy	16	6
not glossy	119	96

Using a significance level of 0.1, determine whether the treatment causes an effect on the proportion of cases that are glossy.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

State the hypotheses.

$$H_0: p_2 - p_1 = 0$$

$$H_{A}: p_{2}-p_{1} \neq 0$$

Find z^* such that $P(|Z| > z^*) = 0.1$.

$$z^* = \Phi^{-1} \left(1 - \frac{\alpha}{2} \right) = 1.64$$

Determine the sample proportions.

$$\hat{p}_1 = \frac{16}{135} = 0.119$$

$$\hat{p}_2 = \frac{6}{102} = 0.0588$$

Determine the difference of sample proportions.

$$\hat{p}_2 - \hat{p}_1 = 0.0588 - 0.119 = -0.0602$$

Determine the pooled proportion (because the null assumes the population proportions are equal).

$$\hat{p} = \frac{16+6}{135+102} = 0.0928$$

Determine the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n_1} + \frac{\hat{p}(1-\hat{p})}{n_2}}$$

$$= \sqrt{\frac{(0.0928)(0.9072)}{135} + \frac{(0.0928)(0.9072)}{102}}$$

$$= 0.0381$$

We can be more specific about what the null hypothesis claims.

$$H_0: \hat{P}_2 - \hat{P}_1 \sim \mathcal{N}(0, 0.0381)$$

We want to describe how unusual our observation is under the null by finding the p-value. To do so, first find the z score.

$$Z = \frac{(\hat{p}_2 - \hat{p}_1) - (p_2 - p_1)_0}{SE}$$
$$= \frac{(0.0588 - 0.119) - 0}{0.0381}$$
$$= -1.58$$

Determine the *p*-value.

$$p$$
-value = $2 \cdot \Phi(-|z|)$
= $2 \cdot \Phi(-1.58)$
= 0.1142

Compare the *p*-value to the signficance level.

$$p$$
-value $> \alpha$

So, we retain the null hypothesis. Thus the difference in proportions is not significant.

- (a) $H_0: p_2 p_1 = 0$
- (b) $H_A: p_2 p_1 \neq 0$
- (c) $z^* = 1.64$
- (d) SE = 0.0381
- (e) $|z_{obs}| = 1.58$
- (f) p-value = 0.1142
- (g) retain the null
