Bunker Hill Community College

Final Statistics Exam 2019-05-02

Exam ID 017

Name:
is take-home exam is due Wednesday, May 8 , at the beginning of class.
u may use any notes, textbook, or online tools; however, you may not request help from a ner human.
u will show your work on the pages with questions. When you are sure of your answers, you those answers in the boxes on the first few pages.
less you have an objection to doing so, please copy the honor-code text below and sign
understand that outside help is NOT allowed on this exam. On my honor, the work herein my own.
Signature:

- 1. (a) P(bike) = 0.296
 - (b) P(gem given yellow) = 0.118
 - (c) P(cat and black) = 0.0807
 - (d) P(yellow) = 0.342
 - (e) P(yellow given bike) = 0.399
 - (f) P(dog or orange) = 0.46
- 2. P("dog" given "gray") = 0.113
- 3. P(62.43 < X < 63.23) = 0.7348
- 4. (a) P(X = 140) = 0.0529
 - (b) $P(138 \le X \le 153) = 0.7618$
- 5. **(18, 21.4)**
- 6. (a) H_0 : $\mu_2 \mu_1 = 0$
 - (b) $H_0: \mu_2 \mu_1 \neq 0$
 - (c) $t^* = 2.1$
 - (d) SE = 0.54
 - (e) $| t_{obs} | = 2.17$
 - (f) 0.02 < p-value < 0.04
 - (g) reject
- 7. (a) **LB of p CI = 0.481 or** 48.1%
 - (b) **UB of p CI = 0.489 or** 48.9%

8. (a)
$$H_0: p_2 - p_1 = 0$$

(b)
$$H_{A}: p_2 - p_1 \neq 0$$

(c)
$$Z^* = 2.81$$

(d)
$$SE = 0.16$$

(e)
$$|Z_{obs}| = 2.73$$

(f)
$$p$$
-value = 0.0064

1. In a deck of strange cards, there are 669 cards. Each card has an image and a color. The amounts are shown in the table below.

	black	orange	yellow
bike	31	88	79
cat	54	23	84
dog	45	83	39
gem	86	30	27

- (a) What is the probability a random card is a bike?
- (b) What is the probability a random card is a gem given it is yellow?
- (c) What is the probability a random card is both a cat and black?
- (d) What is the probability a random card is yellow?
- (e) What is the probability a random card is yellow given it is a bike?
- (f) What is the probability a random card is either a dog or orange (or both)?

(a)
$$P(bike) = \frac{31+88+79}{669} = 0.296$$

(b)
$$P(\text{gem given yellow}) = \frac{27}{79+84+39+27} = 0.118$$

(c)
$$P(\text{cat and black}) = \frac{54}{669} = 0.0807$$

(d)
$$P(\text{yellow}) = \frac{79+84+39+27}{669} = 0.342$$

(e)
$$P(\text{yellow given bike}) = \frac{79}{31+88+79} = 0.399$$

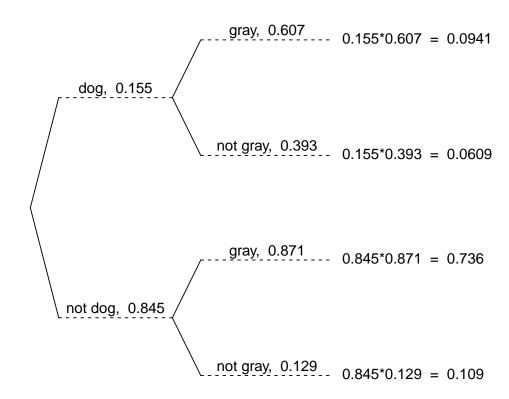

(f)
$$P(\text{dog or orange}) = \frac{45+83+39+88+23+83+30-83}{669} = 0.46$$

2. In a deck of strange cards, each card has an image and a color. The chance of drawing a dog is 15.5%. If a dog is drawn, there is a 60.7% chance that it is gray. If a card that is not a dog is drawn, there is a 87.1% chance that it is gray.

Now, someone draws a random card and reveals it is gray. What is the chance the card is a dog?

I'd recommend making a tree. Remember, on the first branch, we put simple probabilities. On the second branches we put conditional probabilities. The results (products) are joint probabilities.

Determine the appropriate conditional probability.

$$P(\text{"dog" given "gray"}) = \frac{0.0941}{0.0941 + 0.736} = 0.113$$

3. In a very large pile of toothpicks, the mean length is 62.68 millimeters and the standard deviation is 3.23 millimeters. If you randomly sample 100 toothpicks, what is the chance the sample mean is between 62.43 and 63.23 millimeters?

Label the given information.

$$\mu = 62.68$$
 $\sigma = 3.23$
 $n = 100$
 $\bar{x}_{lower} = 62.43$
 $\bar{x}_{upper} = 63.23$

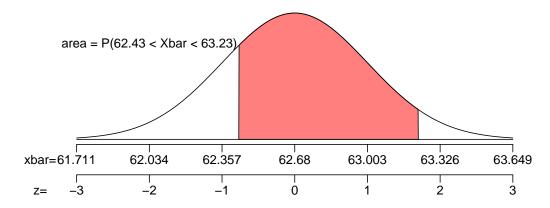

Find the standard error.

$$SE = \frac{\sigma}{\sqrt{n}} = \frac{3.23}{\sqrt{100}} = 0.323$$

Describe the sampling distribution.

$$\bar{X} \sim \mathcal{N}(62.68, 0.323)$$

Draw a sketch.

Calculate a z scores.

$$z_{\text{lower}} = \frac{x_{\text{lower}} - \mu}{SE} = \frac{62.43 - 62.68}{0.323} = -0.77$$

$$z_{\text{upper}} = \frac{x_{\text{upper}} - \mu}{SE} = \frac{63.23 - 62.68}{0.323} = 1.7$$

Determine the probability.

$$P(62.43 < X < 63.23) = \Phi(z_{\text{upper}}) - \Phi(z_{\text{lower}})$$

= $\Phi(1.7) - \Phi(-0.77)$
= 0.7348

- 4. In a game, there is a 71% chance to win a round. You will play 202 rounds.
 - (a) What is the probability of winning exactly 140 rounds?
 - (b) What is the probability of winning at least 138 but at most 153 rounds?

We use the formula for binomial probabilities.

$$P(X = k) = \binom{n}{k} (p)^k (1 - p)^{n-k}$$

$$P(X = 140) = \binom{202}{140} (0.71)^{140} (1 - 0.71)^{202 - 140}$$

$$P(X = 140) = \binom{202}{140} (0.71)^{140} (0.29)^{62}$$

$$P(X = 140) = 0.0529$$

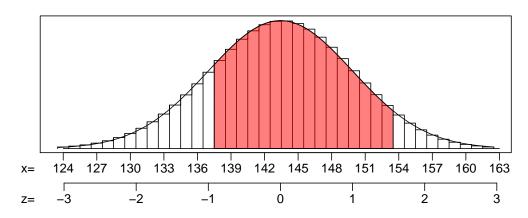

Find the mean.

$$\mu = np = (202)(0.71) = 143.42$$

Find the standard deviation.

$$\sigma = \sqrt{np(1-p)} = \sqrt{(202)(0.71)(1-0.71)} = 6.4492$$

Make a sketch, specifically try to picture whether you need to add or subtract 0.5 for the continuity correction.

Find the z scores.

$$z_1 = \frac{137.5 - 143.42}{6.4492} = -0.92$$

$$Z_2 = \frac{153.5 - 143.42}{6.4492} = 1.56$$

Calculate the probability.

$$P(138 < X < 153) = \Phi(1.56) - \Phi(-0.92) = 0.7618$$

(a)
$$P(X = 140) = 0.0529$$

(b)
$$P(138 \le X \le 153) = 0.7618$$

5. As an ornithologist, you wish to determine the average body mass of *Seiurus noveboracensis*. You randomly sample 20 adults of *Seiurus noveboracensis*, resulting in a sample mean of 19.69 grams and a sample standard deviation of 3.44 grams. Determine a 96% confidence interval of the true population mean.

We are given the sample size, sample mean, sample standard deviation, and confidence level.

$$n = 20$$

 $\bar{x} = 19.69$
 $s = 3.44$
 $CL = 0.96$

Determine the degrees of freedom (because we don't know σ and we are doing inference so we need to use the t distribution).

$$df = n - 1 = 19$$

Determine the critical t value, t^* , such that $P(|T| < t^*) = 0.96$.

$$t^* = 2.2$$

Calculate the standard error.

$$SE = \frac{s}{\sqrt{n}} = \frac{3.44}{\sqrt{20}} = 0.769$$

We want to make an inference about the population mean.

$$\mu \approx \bar{x} \pm t^* SE$$

Determine the bounds.

$$CI = (\bar{x} - t^*SE, \ \bar{x} + t^*SE)$$

= $(19.69 - 2.2 \times 0.769, \ 19.69 + 2.2 \times 0.769)$
= $(18, \ 21.4)$

We are 96% confident that the population mean is between 18 and 21.4.

6. A treatment group of size 32 has a mean of 11 and standard deviation of 2.08. A control group of size 36 has a mean of 9.83 and standard deviation of 2.37. If you decided to use a signficance level of 0.04, is there sufficient evidence to conclude the treatment causes an effect?

By using the Welch-Satterthwaite equation, I've calculated the degrees of freedom should be 65.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

We are given unpaired data. We are considering a difference of means. Label the given information.

$$n_1 = 32$$

 $\bar{x}_1 = 11$
 $s_1 = 2.08$
 $n_2 = 36$
 $\bar{x}_2 = 9.83$
 $s_2 = 2.37$
 $\alpha = 0.04$
 $df = 65$

State the hypotheses.

$$H_0: \mu_2 - \mu_1 = 0$$

 $H_A: \mu_2 - \mu_1 \neq 0$

We are using a two-tail test. Find t^* such that $P(|T| > t^*) = 0.04$ by using a t table.

$$t^* = 2.1$$

Calculate the standard error.

$$SE = \sqrt{\frac{(s_1)^2}{n_1} + \frac{(s_2)^2}{n_2}}$$
$$= \sqrt{\frac{(2.08)^2}{32} + \frac{(2.37)^2}{36}}$$
$$= 0.54$$

Determine the test statistic.

$$t_{\text{obs}} = \frac{(\bar{x}_2 - \bar{x}_1) - (\mu_2 - \mu_1)_0}{SE}$$
$$= \frac{(9.83 - 11) - (0)}{0.54}$$
$$= -2.17$$

Compare $|t_{obs}|$ and t^* .

$$|\mathit{t}_{\mathsf{obs}}| > \mathit{t}^{\star}$$

We can determine an interval for the *p*-value using the *t* table.

Compare *p*-value and α .

$$p$$
-value $< \alpha$

We conclude that we should reject the null hypothesis.

(a)
$$H_0$$
: $\mu_2 - \mu_1 = 0$

- (b) H_A : $\mu_2 \mu_1 \neq 0$
- (c) $t^* = 2.1$
- (d) SE = 0.54
- (e) $|t_{obs}| = 2.17$
- (f) 0.02 < p-value < 0.04
- (g) reject the null

- 7. From a very large population, a random sample of 67000 individuals was taken. In that sample, 48.5% were cold. Determine a 98% confidence interval of the population proportion.
 - (a) Find the lower bound of the confidence interval.
 - (b) Find the upper bound of the condifence interval.

Determine z^* such that $P(|Z| < z^*) = 0.98$.

$$z^* = 2.33$$

Calculate the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n}} = \sqrt{\frac{(0.485)(1-0.485)}{67000}} = 0.00193$$

Calculate the margin of error.

$$ME = z^*SE = (2.33)(0.00193) = 0.0045$$

To find the confidence interval's bounds, find the sample proportion plus or minus the margin of error.

$$p \approx \hat{p} \pm ME$$

Determine the interval.

We are 98% confident that the true population proportion is between 48.1% and 48.9%.

- (a) The lower bound = 0.481, which can also be expressed as 48.1%.
- (b) The upper bound = 0.489, which can also be expressed as 48.9%.

8. An experiment is run with a treatment group of size 27 and a control group of size 15. The results are summarized in the table below.

	treatment	control
reclusive	19	4
not reclusive	8	11

Using a significance level of 0.005, determine whether the treatment causes an effect on the proportion of cases that are reclusive.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

State the hypotheses.

$$H_0: p_2 - p_1 = 0$$

 $H_A: p_2 - p_1 \neq 0$

Find z^* such that $P(|Z| > z^*) = 0.005$.

$$z^* = \Phi^{-1} \left(1 - \frac{\alpha}{2} \right) = 2.81$$

Determine the sample proportions.

$$\hat{p}_1 = \frac{19}{27} = 0.704$$

$$\hat{p}_2 = \frac{4}{15} = 0.267$$

Determine the difference of sample proportions.

$$\hat{p}_2 - \hat{p}_1 = 0.267 - 0.704 = -0.437$$

Determine the pooled proportion (because the null assumes the population proportions are equal).

$$\hat{p} = \frac{19+4}{27+15} = 0.548$$

Determine the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n_1} + \frac{\hat{p}(1-\hat{p})}{n_2}}$$
$$= \sqrt{\frac{(0.548)(0.452)}{27} + \frac{(0.548)(0.452)}{15}}$$
$$= 0.16$$

We can be more specific about what the null hypothesis claims.

$$H_0: \hat{P}_2 - \hat{P}_1 \sim \mathcal{N}(0, 0.16)$$

We want to describe how unusual our observation is under the null by finding the p-value. To do so, first find the z score.

$$Z = \frac{(\hat{p}_2 - \hat{p}_1) - (p_2 - p_1)_0}{SE}$$
$$= \frac{(0.267 - 0.704) - 0}{0.16}$$
$$= -2.73$$

Determine the *p*-value.

$$p$$
-value = $2 \cdot \Phi(-|z|)$
= $2 \cdot \Phi(-2.73)$
= 0.0064

Compare the *p*-value to the signficance level.

$$p$$
-value $> \alpha$

So, we retain the null hypothesis. Thus the difference in proportions is not significant.

- (a) $H_0: p_2 p_1 = 0$
- (b) $H_A: p_2 p_1 \neq 0$
- (c) $z^* = 2.81$
- (d) SE = 0.16
- (e) $|z_{obs}| = 2.73$
- (f) p-value = 0.0064
- (g) retain the null
