Bunker Hill Community College

Final Statistics Exam 2019-05-02

Exam ID 014

Name:
This take-home exam is due Wednesday , May 8 , at the beginning of class.
You may use any notes, textbook, or online tools; however, you may not request help from any other human.
You will show your work on the pages with questions. When you are sure of your answers, you will put those answers in the boxes on the first few pages.
Unless you have an objection to doing so, please copy the honor-code text below and sign.
I understand that outside help is NOT allowed on this exam. On my honor, the work herein is my own.
Signature:

- 1. (a) P(horn or red) = 0.449
 - (b) P(horn) = 0.242
 - (c) P(wheel and red) = 0.0746
 - (d) P(orange) = 0.357
 - (e) P(shovel given orange) = 0.0514
 - (f) P(teal given dog) = 0.453
- 2. P("tree" given "green") = 0.0532
- 3. P(61.96 < X < 62.41) = 0.6884
- 4. (a) P(X = 32) = 0.1093
 - (b) $P(29 \le X \le 35) = 0.6159$
- 5. **(11.5, 12.6)**
- 6. (a) H_0 : $\mu_2 \mu_1 = 0$
 - (b) $H_0: \mu_2 \mu_1 \neq 0$
 - (c) $t^* = 2.13$
 - (d) SE = 0.049
 - (e) $| t_{obs} | = 1.83$
 - (f) 0.05 < p-value < 0.1
 - (g) retain
- 7. (a) **LB of p CI = 0.496 or** 49.6%
 - (b) **UB of p CI = 0.516 or** 51.6%

8. (a)
$$H_0: p_2 - p_1 = 0$$

(b)
$$H_{A}: p_2 - p_1 \neq 0$$

(c)
$$Z^* = 2.81$$

(d)
$$SE = 0.141$$

(e)
$$|Z_{obs}| = 2.75$$

(f)
$$p$$
-value = 0.006

1. In a deck of strange cards, there are 818 cards. Each card has an image and a color. The amounts are shown in the table below.

	orange	red	teal
dog	75	41	96
gem	63	25	52
horn	94	21	83
shovel	15	42	72
wheel	45	61	33

- (a) What is the probability a random card is either a horn or red (or both)?
- (b) What is the probability a random card is a horn?
- (c) What is the probability a random card is both a wheel and red?
- (d) What is the probability a random card is orange?
- (e) What is the probability a random card is a shovel given it is orange?
- (f) What is the probability a random card is teal given it is a dog?

(a)
$$P(\text{horn or red}) = \frac{94+21+83+41+25+21+42+61-21}{818} = 0.449$$

(b)
$$P(horn) = \frac{94+21+83}{818} = 0.242$$

(c)
$$P(\text{wheel and red}) = \frac{61}{818} = 0.0746$$

(d)
$$P(\text{orange}) = \frac{75+63+94+15+45}{818} = 0.357$$

(e)
$$P(\text{shovel given orange}) = \frac{15}{75+63+94+15+45} = 0.0514$$

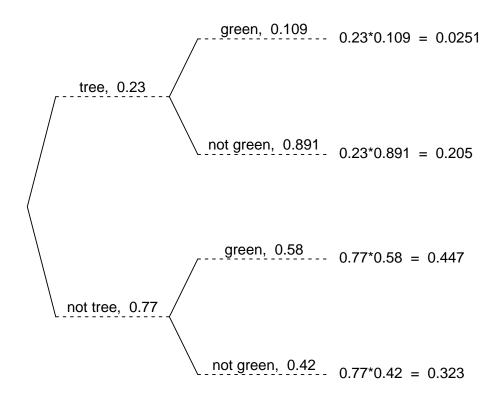

(f)
$$P(\text{teal given dog}) = \frac{96}{75+41+96} = 0.453$$

2. In a deck of strange cards, each card has an image and a color. The chance of drawing a tree is 23%. If a tree is drawn, there is a 10.9% chance that it is green. If a card that is not a tree is drawn, there is a 58% chance that it is green.

Now, someone draws a random card and reveals it is green. What is the chance the card is a tree?

I'd recommend making a tree. Remember, on the first branch, we put simple probabilities. On the second branches we put conditional probabilities. The results (products) are joint probabilities.

Determine the appropriate conditional probability.

$$P("tree" given "green") = {0.0251 \over 0.0251 + 0.447} = 0.0532$$

3. In a very large pile of toothpicks, the mean length is 62.13 millimeters and the standard deviation is 3.02 millimeters. If you randomly sample 196 toothpicks, what is the chance the sample mean is between 61.96 and 62.41 millimeters?

Label the given information.

$$\mu = 62.13$$
 $\sigma = 3.02$
 $n = 196$
 $\bar{x}_{lower} = 61.96$
 $\bar{x}_{upper} = 62.41$

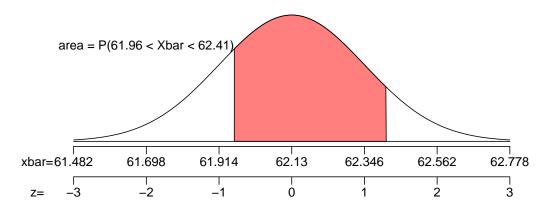

Find the standard error.

$$SE = \frac{\sigma}{\sqrt{n}} = \frac{3.02}{\sqrt{196}} = 0.216$$

Describe the sampling distribution.

$$\bar{X} \sim \mathcal{N}(62.13, 0.216)$$

Draw a sketch.

Calculate a z scores.

$$z_{\text{lower}} = \frac{x_{\text{lower}} - \mu}{SE} = \frac{61.96 - 62.13}{0.216} = -0.79$$

$$z_{\text{upper}} = \frac{x_{\text{upper}} - \mu}{SE} = \frac{62.41 - 62.13}{0.216} = 1.3$$

Determine the probability.

$$P(61.96 < X < 62.41) = \Phi(z_{upper}) - \Phi(z_{lower})$$

= $\Phi(1.3) - \Phi(-0.79)$
= 0.6884

- 4. In a game, there is a 75% chance to win a round. You will play 45 rounds.
 - (a) What is the probability of winning exactly 32 rounds?
 - (b) What is the probability of winning at least 29 but at most 35 rounds?

We use the formula for binomial probabilities.

$$P(X = k) = \binom{n}{k} (p)^k (1 - p)^{n-k}$$

$$P(X = 32) = \binom{45}{32} (0.75)^{32} (1 - 0.75)^{45-32}$$

$$P(X = 32) = \binom{45}{32} (0.75)^{32} (0.25)^{13}$$

$$P(X = 32) = 0.1093$$

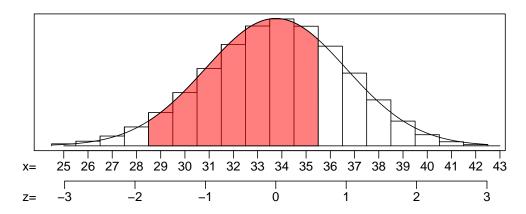

Find the mean.

$$\mu = np = (45)(0.75) = 33.75$$

Find the standard deviation.

$$\sigma = \sqrt{np(1-p)} = \sqrt{(45)(0.75)(1-0.75)} = 2.9047$$

Make a sketch, specifically try to picture whether you need to add or subtract 0.5 for the continuity correction.

Find the z scores.

$$z_1 = \frac{28.5 - 33.75}{2.9047} = -1.64$$

$$Z_2 = \frac{35.5 - 33.75}{2.9047} = 0.43$$

Calculate the probability.

$$P(29 < X < 35) = \Phi(0.43) - \Phi(-1.64) = 0.6159$$

(a)
$$P(X = 32) = 0.1093$$

(b)
$$P(29 \le X \le 35) = 0.6159$$

5. As an ornithologist, you wish to determine the average body mass of *Dendroica coronata*. You randomly sample 14 adults of *Dendroica coronata*, resulting in a sample mean of 12.09 grams and a sample standard deviation of 1.54 grams. Determine a 80% confidence interval of the true population mean.

We are given the sample size, sample mean, sample standard deviation, and confidence level

$$n = 14$$

 $\bar{x} = 12.09$
 $s = 1.54$
 $CL = 0.8$

Determine the degrees of freedom (because we don't know σ and we are doing inference so we need to use the t distribution).

$$df = n - 1 = 13$$

Determine the critical t value, t^* , such that $P(|T| < t^*) = 0.8$.

$$t^* = 1.35$$

Calculate the standard error.

$$SE = \frac{s}{\sqrt{n}} = \frac{1.54}{\sqrt{14}} = 0.412$$

We want to make an inference about the population mean.

$$\mu \approx \bar{x} \pm t^* SE$$

Determine the bounds.

$$CI = (\bar{x} - t^*SE, \bar{x} + t^*SE)$$

= $(12.09 - 1.35 \times 0.412, 12.09 + 1.35 \times 0.412)$
= $(11.5, 12.6)$

We are 80% confident that the population mean is between 11.5 and 12.6.

6. A treatment group of size 19 has a mean of 1.12 and standard deviation of 0.166. A control group of size 25 has a mean of 1.03 and standard deviation of 0.155. If you decided to use a signficance level of 0.04, is there sufficient evidence to conclude the treatment causes an effect?

By using the Welch-Satterthwaite equation, I've calculated the degrees of freedom should be 37.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

We are given unpaired data. We are considering a difference of means. Label the given information.

$$n_1 = 19$$

 $\bar{x}_1 = 1.12$
 $s_1 = 0.166$
 $n_2 = 25$
 $\bar{x}_2 = 1.03$
 $s_2 = 0.155$
 $\alpha = 0.04$
 $df = 37$

State the hypotheses.

$$H_0: \mu_2 - \mu_1 = 0$$

 $H_A: \mu_2 - \mu_1 \neq 0$

We are using a two-tail test. Find t^* such that $P(|T| > t^*) = 0.04$ by using a t table.

$$t^* = 2.13$$

Calculate the standard error.

$$SE = \sqrt{\frac{(s_1)^2}{n_1} + \frac{(s_2)^2}{n_2}}$$
$$= \sqrt{\frac{(0.166)^2}{19} + \frac{(0.155)^2}{25}}$$
$$= 0.049$$

Determine the test statistic.

$$t_{\text{obs}} = \frac{(\bar{x}_2 - \bar{x}_1) - (\mu_2 - \mu_1)_0}{SE}$$
$$= \frac{(1.03 - 1.12) - (0)}{0.049}$$
$$= -1.83$$

Compare $|t_{obs}|$ and t^* .

$$|\mathit{t}_{\mathsf{obs}}| < \mathit{t}^{\star}$$

We can determine an interval for the *p*-value using the *t* table.

Compare *p*-value and α .

$$p$$
-value $> \alpha$

We conclude that we should retain the null hypothesis.

(a)
$$H_0$$
: $\mu_2 - \mu_1 = 0$

- (b) H_A : $\mu_2 \mu_1 \neq 0$
- (c) $t^* = 2.13$
- (d) SE = 0.049
- (e) $|t_{obs}| = 1.83$
- (f) 0.05 < p-value < 0.1
- (g) retain the null

- 7. From a very large population, a random sample of 6300 individuals was taken. In that sample, 50.6% were angry. Determine a 90% confidence interval of the population proportion.
 - (a) Find the lower bound of the confidence interval.
 - (b) Find the upper bound of the condifence interval.

Determine z^* such that $P(|Z| < z^*) = 0.9$.

$$z^* = 1.64$$

Calculate the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n}} = \sqrt{\frac{(0.506)(1-0.506)}{6300}} = 0.0063$$

Calculate the margin of error.

$$ME = z^*SE = (1.64)(0.0063) = 0.0103$$

To find the confidence interval's bounds, find the sample proportion plus or minus the margin of error.

$$p \approx \hat{p} \pm ME$$

Determine the interval.

We are 90% confident that the true population proportion is between 49.6% and 51.6%.

- (a) The lower bound = 0.496, which can also be expressed as 49.6%.
- (b) The upper bound = 0.516, which can also be expressed as 51.6%.

8. An experiment is run with a treatment group of size 55 and a control group of size 14. The results are summarized in the table below.

	treatment	control
happy	14	9
not happy	41	5

Using a significance level of 0.005, determine whether the treatment causes an effect on the proportion of cases that are happy.

- (a) State the null hypothesis.
- (b) State the alternative hypothesis.
- (c) Evaluate the critical value. (The critical value is either z^* or t^* . Determine its value.)
- (d) Determine the standard error of the relevant sampling distribution.
- (e) Evaluate the absolute value of the test statistic. (The test statistic is either z_{obs} or t_{obs} . Determine its absolute value.)
- (f) If possible, evaluate the p-value. Otherwise, describe an interval containing the p-value.
- (g) Do we reject or retain the null?

State the hypotheses.

$$H_0: p_2 - p_1 = 0$$

 $H_A: p_2 - p_1 \neq 0$

Find z^* such that $P(|Z| > z^*) = 0.005$.

$$z^* = \Phi^{-1} \left(1 - \frac{\alpha}{2} \right) = 2.81$$

Determine the sample proportions.

$$\hat{p}_1 = \frac{14}{55} = 0.255$$

$$\hat{p}_2 = \frac{9}{14} = 0.643$$

Determine the difference of sample proportions.

$$\hat{p}_2 - \hat{p}_1 = 0.643 - 0.255 = 0.388$$

Determine the pooled proportion (because the null assumes the population proportions are equal).

$$\hat{p} = \frac{14 + 9}{55 + 14} = 0.333$$

Determine the standard error.

$$SE = \sqrt{\frac{\hat{p}(1-\hat{p})}{n_1} + \frac{\hat{p}(1-\hat{p})}{n_2}}$$
$$= \sqrt{\frac{(0.333)(0.667)}{55} + \frac{(0.333)(0.667)}{14}}$$
$$= 0.141$$

We can be more specific about what the null hypothesis claims.

$$H_0: \hat{P}_2 - \hat{P}_1 \sim \mathcal{N}(0, 0.141)$$

We want to describe how unusual our observation is under the null by finding the p-value. To do so, first find the z score.

$$Z = \frac{(\hat{p}_2 - \hat{p}_1) - (p_2 - p_1)_0}{SE}$$
$$= \frac{(0.643 - 0.255) - 0}{0.141}$$
$$= 2.75$$

Determine the *p*-value.

$$p$$
-value = $2 \cdot \Phi(-|z|)$
= $2 \cdot \Phi(-2.75)$
= 0.006

Compare the *p*-value to the signficance level.

$$p$$
-value $> \alpha$

So, we retain the null hypothesis. Thus the difference in proportions is not significant.

- (a) $H_0: p_2 p_1 = 0$
- (b) $H_A: p_2 p_1 \neq 0$
- (c) $z^* = 2.81$
- (d) SE = 0.141
- (e) $|z_{obs}| = 2.75$
- (f) p-value = 0.006
- (g) retain the null
